

# **Engineering Tripos Part IIA, 3F8: Inference, 2020-21**

## **Leader**

[Prof R.E. Turner](#) [1]

## **Lecturer**

Prof R.E. Turner, Dr Jose Miguel Hernandez-Lobato

## **Lab Leader**

Dr Jose Miguel Hernandez-Lobato

## **Timing and Structure**

Lent Term.

## **Prerequisites**

3F3 Statistical Signal Processing

## **Aims**

The aims of the course are to:

- Provide a thorough introduction into the topic of statistical inference including maximum-likelihood and Bayesian approaches
- Introduce inference algorithms for regression, classification, clustering and sequence modelling
- Introduce basic concepts in optimisation, dynamic programming and Monte Carlo sampling

## **Objectives**

As specific objectives, by the end of the course students should be able to:

- Understand the use of maximum-likelihood and Bayesian inference and the strengths and weaknesses of both approaches.
- Implement methods to solve simple regression, classification, clustering and sequence modelling problems.
- Implement simple optimisation methods (gradient and coordinate descent, stochastic gradient descent), dynamic programming (Kalman filter or Viterbi decoding) and Monte Carlo sampling.

## **Content**

### **Introduction to inference (2L)**

- **Bayesian inference, decision theory, estimation**

## Regression (3L)

- [REDACTED]

## Classification (2L)

- [REDACTED]

## Dimensionality Reduction (2L)

- [REDACTED]

## Clustering (3L)

- [REDACTED]

## Sequence models (3L)

- [REDACTED]

## Very Basic Monte Carlo (introduced through the lectures above)

- [REDACTED]

## Further notes

Lecture allocations above are approximate.

## Coursework

Title: **Logistic Regression for Binary Classification**

To implement an algorithm for performing classification, called logistic regression, using gradient descent optimisation.

Learning objectives:

- understand the logistic regression model through visualising predictions
- how to apply maximum likelihood and MAP fitting using optimisation
- how to implement gradient ascent
- understand how feature expansions can turn linear methods into non-linear methods

Practical information:

- Sessions will take place in the DPO, during week(s) [TBD].
- This activity involves a small amount of preliminary work [estimated duration 1hr].

Full Technical Report:

Students will have the option to submit a Full Technical Report.

## Booklists

There is no required textbook. However, the material covered is treated excellent recent text books:

Kevin P. Murphy Machine Learning: a Probabilistic Perspective [2], the MIT Press (2012).

David Barber Bayesian Reasoning and Machine Learning [3], Cambridge University Press (2012), available freely on the web.

Christopher M. Bishop Pattern Recognition and Machine Learning [4]. Springer (2006)

David J.C. MacKay Information Theory, Inference, and Learning Algorithms [5], Cambridge University Press (2003), available freely on the web.

## Examination Guidelines

Please refer to [Form & conduct of the examinations](#) [6].
